<b>1.</b>	<b>DESCRIPTION: &lt; REFER GAM 001&gt;</b>  0 Size hard gelatin capsule having Red coloured plain cap and Red coloured plain body with GHPL printed logo.
<b>2.</b>	<b>IDENTIFICATION: &lt; REFER GAM 003&gt;</b>  Boil one capsule shell with 20ml of water allow to cool and centrifuge. To 5ml of the supernatant liquid add 1ml of picric acid solution and to another 5ml add 1ml of tannic acid solution, a precipitate is produced in each case.
<b>3.</b>	<b>ODOUR:</b>  Keep 100 capsule shells in a well closed bottle for 24 hours at a temperature between 30° and 40°. The shells do not develop any foreign odour.
<b>4.</b>	<b>AVERAGE WEIGHT:</b>  Weigh 100 capsule shells and determine the average weight of a capsule. The average weight is within $\pm 10$ per cent of the target weight.
<b>5.</b>	<b>DIMENSION OF EMPTY CAPSULE SHELL:</b>  Dimension of hard empty gelatin capsules is determined using vernier scale.
<b>6.</b>	<b>DISINTEGRATION:</b>  Not more than 15 minutes, using discs.
<b>7.</b>	<b>LOSS ON DRYING: &lt; REFER GAM 026&gt;</b>  12.5 to 16.0% w/w, determined on 1.0g by drying in an oven at 105°C for 4 hours or to constant weight.
<b>8.</b>	<b>MICROBIAL CONTAMINATION:</b>  Total Viable aerobic count and Pathogen test refer as per the current SOP No: ST/MB/011.

Carrier gas : Helium for chromatography  
Split ratio : 1:100  
Column temperature : 280°C  
Injection port and detector : 290°C  
Detection : Flame ionisation  
Runtime : 1.1 times the retention time of  $\alpha$ -Tocopheryl acetate  
Injection : 1 $\mu$ l; inject directly onto the column or via a sufficiently inert, glass-lined injection port

**Internal standard solution:**

Dissolve 1.0g of Squalane in cyclone and dilute to 500ml with the same solvent.

**Test solution:**

Weigh accurately a quantity of the preparation to be examine corresponding to about 0.100g of  $\alpha$ -Tocopheryl acetate into a 250ml conical flask. Add 20ml of 1M hydrochloric acid and sonicate at 70°C for 20 minutes. Add 50ml of anhydrous ethanol and 50.0ml of the internal standard solution. Mix thoroughly for 30 minutes using a magnetic stirrer. Allow the 2 layers to separate and use the upper layer.

**Reference solution (a):**

Dissolve 0.100g of  $\alpha$ -Tocopheryl acetate in 50.0ml of the internal standard solution.

**Reference solution (b):**

Dissolve 10mg of  $\alpha$ -Tocopheryl and 10mg of  $\alpha$ -Tocopheryl acetate CRS in 5.0ml of cyclohexane.

**Reference solution (c):**

Mix 1.0ml of the test solution and 1.0ml of reference solution (a).

**Relative retention:**

With reference to  $\alpha$ -Tocopheryl acetate (retention time = about 12minutes); squalane = about 0.5;  $\alpha$ -Tocopheryl = about 0.9.

**System suitability:**

Resolution: minimum 3.5 between the peaks due to  $\alpha$ -Tocopheryl and  $\alpha$ -Tocopheryl acetate in the chromatogram obtained with reference solution (b);

In the chromatogram obtained with reference solution (a), the area of the peak due to  $\alpha$ -Tocopheryl is not greater than 0.002 times the area of the peak due to  $\alpha$ -Tocopheryl acetate (0.2%)

Calculate the percentage content of  $\alpha$ -Tocopheryl acetate from the declared content of  $\alpha$ -Tocopheryl acetate.

S.NO	TEST (s)	SPECIFICATION (s)
1.	*Description	White or almost white, crystalline powder or colourless crystals, becoming discoloured on exposure to air and moisture.
2.	*Solubility	Freely soluble in water, sparingly soluble in ethanol (96%).
3.	*Identification  <b>A.</b> By UV  <b>B.</b> By IR   <b>C.</b> By pH  <b>D.</b> By Chemical test	Between 545 to 585.  The Infrared absorption spectrum of sample should be concordant with that of reference spectrum or with the spectrum obtained from Ascorbic acid WS.  Between 2.1 to 2.6.  A grey precipitate is formed.
4.	Appearance of solution	Solution S is clear and not more intensely coloured than reference solution BY7.
5.	*Specific optical rotation	Between +20.5° to +21.5°
6.	Impurity E	Not more than 0.2%

<b>1. DESCRIPTION: &lt; REFER GAM 001&gt;</b>	<p>White or almost white, crystalline powder, or colourless crystals.</p>				
<b>2. SOLUBILITY: &lt; REFER GAM 002&gt;</b>	<table border="1"> <tr> <td>10mg of sample + 100mL of Water</td> <td>Practically insoluble if the material not dissolves.</td> </tr> <tr> <td>10mg of sample + 100mL of Ethanol (96%)</td> <td>Practically insoluble if the material not dissolves.</td> </tr> </table> <p>It dissolves in dilute hydrochloric acid and in dilute nitric acid.</p>	10mg of sample + 100mL of Water	Practically insoluble if the material not dissolves.	10mg of sample + 100mL of Ethanol (96%)	Practically insoluble if the material not dissolves.
10mg of sample + 100mL of Water	Practically insoluble if the material not dissolves.				
10mg of sample + 100mL of Ethanol (96%)	Practically insoluble if the material not dissolves.				
<b>3. IDENTIFICATION:</b>	<p><b>A. By Chemical test:</b></p> <p>Dissolve with heating 0.1 g in 10 mL of dilute hydrochloric acid. Add 2.5 mL of dilute ammonia, shake, and add 5 mL of a 35 g/L solution of ammonium oxalate. A white precipitate is produced.</p> <p><b>B. By Chemical test:</b></p> <p>Dissolve 0.1 g in 5 mL of dilute nitric acid, add 2 mL of ammonium molybdate solution and heat at 70 °C for 1-2 min. A yellow precipitate is produced.</p> <p><b>SOLUTION S:</b></p> <p>Dissolve 2.5 g in 20 mL of dilute hydrochloric acid, filter if necessary and add dilute ammonia until a precipitate is formed. Add just sufficient dilute hydrochloric acid to dissolve the precipitate and dilute to 50 mL with distilled water.</p>				
<b>4. ACID INSOLUBLE SUBSTANCES:</b>	<p>Maximum 0.2 per cent.</p> <p>Dissolve 5.0 g in 40 mL of water, add 10 mL of hydrochloric acid and heat to boiling for 5 min. Cool, then collect the insoluble substances using ashless filter paper. Wash with water until turbidity is no longer produced when silver nitrate solution is added.</p>

<b>5. CARBONATES:</b>	Ignite the residue and the filter paper at $600 \pm 50$ °C. The residue weighs not more than 10 mg.
	Shake 1.0 g with 5 mL of carbon dioxide-free water and add 2 mL of hydrochloric acid. No effervescence is produced.
	<b>6. CHLORIDES: &lt; REFER GAM 008 &gt;</b>  Maximum 0.25 per cent.  <b>Test solution:</b>  Dissolve 0.20 g in a mixture of 20 mL of water and 13 mL of dilute nitric acid by warming if necessary, dilute to 100 mL with water and filter if necessary. Use 50 mL of this solution.  <b>Reference solution:</b>  To 0.70 mL of 0.01 M hydrochloric acid, add 6 mL of dilute nitric acid and dilute to 50 mL with water R.  Add 1 mL of silver nitrate solution to the test solution and to the reference solution and mix. After standing for 5 min protected from light, any opalescence in the test solution, by viewing vertically or horizontally against a black background, is not more intense than that in the reference solution.
<b>7. FLUORIDES:</b>	Maximum 100 ppm.  Potentiometry (Method II).  Chelating solution: Dissolve 45 g of cyclohexylenedinitrilotetra-acetic acid in 75 mL of sodium hydroxide solution and dilute to 250 mL with water.

**Test solution:**

Dissolve 1.000 g in 4 mL of hydrochloric acid, add 20 mL of chelating solution, 2.7 mL of glacial acetic acid and 2.8 g of sodium chloride, adjust to pH 5-6 with sodium hydroxide solution and dilute to 50.0 mL with water.

**Reference solution:**

Dissolve 4.42 g of sodium fluoride, previously dried at 300 °C for 12 h, in water and dilute to 1000.0 mL with the same solvent. Dilute 50.0 mL of this solution to 500.0 mL with total-ionic-strength-adjustment buffer (200 ppm F).

Indicator electrode Fluoride-selective.

Reference electrode Silver-silver chloride.

Carry out the measurement on 20.0 mL of the test solution. Add at least 3 times 0.10 mL of the reference solution and carry out the measurement after each addition. Calculate the concentration of fluorides using the calibration curve

**8. SULFATES:**

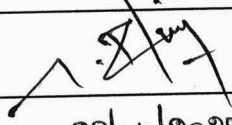

Maximum 0.5 per cent.

**Test solution:**

Dissolve 0.5 g in a mixture of 5 mL of water and 5 mL of dilute hydrochloric acid and dilute to 100 mL with water. Filter if necessary. To 20 mL of this solution, add 1 mL of dilute hydrochloric acid and dilute to 50 mL with water.

**Reference solution:** To 1.0 mL of 0.005 M sulfuric acid, add 1 mL of dilute hydrochloric acid and dilute to 50 mL with water. Filter if necessary.

To the test solution and to the reference solution, add 2 mL of a 120 g/L solution of barium chloride and allow to stand for 10 min. Any opalescence in the test solution, by viewing vertically or horizontally against a black background, is not more intense than that in the reference solution.

	<b>STANDARD TESTING PROCEDURE</b>			
<b>Name of Product</b>	COLLOIDAL ANHYDROUS SILICA BP			
<b>STP No.</b>	STP-RMEC0017-00	<b>Revision No.</b>	00	<b>Item Code.:</b> RMEC0017
<b>Supersedes</b>	RMEC0017-01	<b>Effective Date</b>	18/11/2023	<b>Page No.:</b> 1 of 3

1.	<b>DESCRIPTION: &lt; REFER GAM 001&gt;</b>  White or almost white, light, fine, amorphous powder, with a particle size of about 15nm.				
2.	<b>SOLUBILITY: &lt; REFER GAM 002&gt;</b>  <table border="1" style="width: 100%;"> <tr> <td style="width: 50%;">10mg of sample + 100mL of Water</td> <td>Practically insoluble if the material does not dissolves.</td> </tr> <tr> <td>10mg of sample + 100mL of Mineral acids except hydrofluoric acid.</td> <td>Practically insoluble if the material does not dissolves.</td> </tr> </table> <p>It dissolves in hot solutions of alkali hydroxides.</p>	10mg of sample + 100mL of Water	Practically insoluble if the material does not dissolves.	10mg of sample + 100mL of Mineral acids except hydrofluoric acid.	Practically insoluble if the material does not dissolves.
10mg of sample + 100mL of Water	Practically insoluble if the material does not dissolves.				
10mg of sample + 100mL of Mineral acids except hydrofluoric acid.	Practically insoluble if the material does not dissolves.				
3.	<b>IDENTIFICATION: &lt; REFER GAM 003&gt;</b>  <b>By Silicates:</b>  About 25mg of sample ignited in a platinum crucible at $900 \pm 50^\circ\text{C}$ for 2hour, cool and add about 10 mg of sodium fluoride and a few drops of sulfuric acid to give a thin slurry. Cover the crucible with a thin, transparent plate of plastic under which a drop of water is suspended and warm gently. Within a short time a white ring is rapidly formed around the drop of water.				
4.	<b>pH: &lt; REFER GAM 030&gt;</b>  Between 3.5 to 5.5  Weigh accurately about 1.0g of sample dissolved in 100ml carbon dioxide free water and stirring continuously. Determine the pH when a homogeneous solution is obtained.  Rinse the electrodes with distilled water and wipe dry with tissue paper. Set the instrument using buffer solution pH 6.87 by following instrument Operating Procedure. Clean the electrode. Immerse the electrode in the solution being examined and measure the pH.				
5.	<b>CHLORIDES: &lt;REFER GAM 008&gt;</b>  Not more than 250 ppm.

**1. DESCRIPTION: < REFER GAM 001>**

Dark red, crystalline powder or dark red crystals.

**2. SOLUBILITY: < REFER GAM 002>**

100mg of sample + 10mL of Water	Sparingly soluble if the material dissolve.
100mg of sample + 10mL of Ethanol (96%)	Sparingly soluble if the material dissolve.
10mg of sample + 100mL of Acetone	Practically insoluble if the material does not dissolve.

The anhydrous substance is very hygroscopic.

**3. IDENTIFICATION:**

**A. By UV absorption: < REFER GAM 003>**

**Test solution:** Dissolve 2.5 mg in water R and dilute to 100.0 mL with the same solvent.

**Spectral range:** 260-610 nm.

**Absorption:** maxima 278 nm, 361 nm and 547-559 nm.

**Absorbance ratios:**

—  $A_{361} / A_{547-559} = 3.15$  to  $3.45$ ;

—  $A_{361} / A_{278} = 1.70$  to  $1.90$ .

**B. By HPLC:**

Examine the chromatograms obtained in the test for related substances.

**Results:** The principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (c).

**4. RELATED SUBSTANCES: (Determine by liquid chromatography)**

**Note:** Use the normalisation procedure. Store the solutions at 2-8°C, protected from light, and use them within 24 h.

**Chemicals/Reagents/Standards:**

Cyanocobalamin system suitability (containing impurities A, C, E and F)	: Reference standard
Cyanocobalamin	: Working standard/ Reference standard
Cyanocobalamin peak identification (containing impurities B and D)	: Reference standard
Ammonium formate	: AR grade
Anhydrous formic acid	: AR grade
Purified Water	: Milli Q water (or) equivalent
Methanol	: HPLC grade

**Chromatographic Condition:**

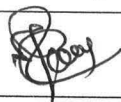

Column	: C8, 150mm x 2.1mm (1.7µm)
Column temperature	: 60°C
Flow rate	: 0.4ml/min
Wavelength	: 361nm
Injection volume	: 3µl

**Mobile phase:**

**Mobile phase A:**

1.0g/L solution of ammonium formate adjusted to pH 3.5±0.05 with anhydrous formic acid.

**Mobile phase B:** Methanol

	<b>Safetab Life Science</b> <b>Puducherry</b>			<div>MASTER COPY</div>
	<b>STANDARD TESTING PROCEDURE</b>			
<b>Name of Product</b>	CYANOCOBALAMIN BP			
<b>STP No.</b>	STP-RMAC0066-01	<b>Revision No.</b>	01	<b>Item Code.:</b> RMAC0066
<b>Supersedes</b>	STP-RMAC0066-00	<b>Effective Date</b>	05/06/2024	<b>Page No.:</b> 7 of 8

**Limits:**

- (i) impurity C: Not more than 1.5 per cent;
- (ii) impurity A: Not more than 0.7 per cent;
- (iii) impurities B, D, E, F: for each impurity, Not more than 0.5 per cent;
- (iv) unspecified impurities: for each impurity, Not more than 0.2 per cent;
- (v) total: Not more than 3.0 per cent;
- (vi) reporting threshold: 0.10 per cent (reference solution (a)).

**5. LOSS ON DRYING: <REFER GAM 026>**

Not more than 12.0 per cent, determined on 0.400g of sample by drying in vacuum at 105°C for 2 hours.

**6. ASSAY: By UV (On dried basis)**

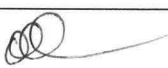

Weigh accurately about 100.0mg of sample, dissolved in water to produce 500ml. Dilute 25.0ml of the solution to 200.0ml with water. Measure the absorbance of the solution at the maximum at about 361nm. Calculate the content of Cyanocobalamin taking the specific absorbance to be 207.

**Calculation:**

$$\frac{\text{ABS}}{0.207} \times \frac{10}{1000} \times \frac{500}{\text{WT}} \times \frac{200}{25} \times \frac{100}{(100 - \text{LOD})} \times 100$$

Where,

ABS = Absorbance of Cyanocobalamin in Sample Preparation.  
WT = Weight of sample taken in mg.

**1. DESCRIPTION: < REFER GAM 001>**

Yellowish or orange, crystalline powder.

**2. SOLUBILITY: < REFER GAM 002>**

10mg of sample +100mL of water and in most organic solvents	Practically insoluble if the material not dissolves
100mg sample + 3ml of dilute acids and in alkaline solutions.	Soluble if the material dissolve.

**3. IDENTIFICATION:**

**A. SPECIFIC OPTICAL ROTATION : < REFER GAM 032>**

Between +18.0° to +22.0°.

Weigh accurately about 0.25g of sample dissolved in 4.2g/L solution of sodium hydroxide and dilute to 25.0ml with the same solution.

**B. By IR : < REFER GAM 003>**

The Infrared absorption spectrum of sample should be concordant with that of reference spectrum or with the spectrum obtained from Folic acid WS.

**C. By Thin-Layer Chromatography: < REFER GAM 003>**

**Plate TLC silica gel plate.**

**Mobile phase:**

A Mixture of 20 volumes of Concentrated ammonia, 20 volumes of Propanol and 60 volumes Ethanol (96 percent).

**Solvent mixture:**

A mixture of 2 volumes of concentrated ammonia and 9 volumes of methanol.

**Test solution:**

Dissolve 50mg of the substance under examination in 100ml of the solvent mixture.

**Reference solution:**

Dissolve 50mg of Folic acid WS in 100ml of the solvent mixture.

**Application:** 2  $\mu$ L.

**Development:** Over 3/4 of the plate.

**Drying:** In air.

**Detection:** Examine in ultraviolet light at 365 nm.

**Results:**

The principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution.

**D. WATER: <REFER GAM 010>**

Between 5.0 to 8.5%,

Potassium dihydrogen phosphate : AR Grade  
Dipotassium hydrogen phosphate : AR Grade  
Sodium carbonate : AR Grade  
Purified Water : Milli Q water (or) Equivalent  
Methanol : HPLC grade

**Chromatographic Condition:**

Column : ZORBAX RX-C8 250mm x 4.0mm, (5 µm) or equivalent  
Flow rate : 0.6 mL / minute  
Detector wavelength : 280 nm  
Injection Volume : 5µl  
Run time : 3.3 times the retention time of folic acid.  
Retention Time : About 8.0 minutes

**Buffer solution:**

Dissolve 11.16g of Potassium dihydrogen phosphate and 5.50g of Dipotassium hydrogen phosphate in 1000mL of water and Adjust to pH 6.4 with dilute phosphoric acid.

**Mobile phase:**

A Mixture of 12 volumes of methanol and 88 volumes of Buffer solution.

**Solution A:**

Dissolve 28.6g of Sodium carbonate in 1000ml of water.

**Test solution:**

Weigh accurately about 50.0mg of the substance under examination in 2.5ml of solution A and dilute to 50.0mL with the mobile phase. Dilute 2.0mL of this solution to 10.0mL with the mobile phase.

**STANDARD TESTING PROCEDURE**

<b>Name of Product</b>	MAGNESIUM STEARATE BP			
<b>STP No.</b>	STP-RMEM0033-00	<b>Revision No.</b>	00	<b>Item Code.:</b> RMEM0033
<b>Supersedes</b>	RMETM0033-01	<b>Effective Date</b>	14/03/2024	<b>Page No.:</b> 3 of 11

Dilute 6.0 ml of Solution S to 40.0 ml with water. Neutralise if necessary with hydrochloric acid using litmus as indicator. Add 1mL of 3M hydrochloric acid and 3mL of a 120g/L solution of barium chloride and dilute to 50mL with water. Mix and allow to stand for 10 min. The turbidity, if any, is not greater than that produced in a solution containing 3.0mL of 0.02M sulfuric acid.

**7. CADMIUM: (ATOMIC ABSORPTION SPECTROMETRY)**

Not more than 3ppm.

For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium, lead and nickel as practicable and store all reagent solutions in containers of borosilicate glass. Clean glassware before use by soaking in warm 8M nitric acid for 30 min and by rinsing with deionised water.

**Blank solution:**

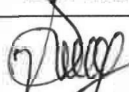

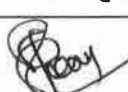

Dilute 25mL of cadmium and lead-free nitric acid to 100.0 mL with water.

**Modifier solution:**

Dissolve 20g of ammonium dihydrogen phosphate and 1g of magnesium nitrate in water and dilute to 100mL with the same solvent. Alternatively, use an appropriate matrix modifier as recommended by the graphite furnace atomic absorption (GFAA) spectrometer manufacturer.

**Test solution:**

Place 0.100g of the substance to be examined in a polytetrafluoroethylene digestion bomb and add 2.5mL of cadmium- and lead-free nitric acid. Close and seal the bomb according to the manufacturer's operating instructions (when using a digestion bomb, be thoroughly familiar with the safety and operating instructions. Carefully follow the bomb manufacturer's instructions regarding care and maintenance of these digestion bombs. Do not use metal jacketed bombs or liners which have been used with hydrochloric acid due to contamination from corrosion of the metal jacket by hydrochloric acid). Heat the bomb in an oven at 170°C for 3 h. Cool the bomb slowly in air to room temperature according to the bomb manufacturer's instructions.

Place the bomb in a fume cupboard and open carefully as corrosive gases may be expelled. Dissolve the residue in water R and dilute to 10.0 mL with the same solvent.

**Reference solution:**

Prepare a solution of 0.0030 µg/mL of Cd by suitable dilutions of a 0.00825 µg/mL solution of cadmium nitrate tetrahydrate in the blank solution.

Dilute 1.0mL of the test solution to 10.0mL with the blank solution. Prepare mixtures of this solution, the reference solution and the blank solution in the following proportions: (1.0:0:1.0 V/V/V), (1.0:0.5:0.5 V/V/V), (1.0:1.0:0 V/V/V).

To each mixture add 50µL of modifier solution and mix. These solutions contain respectively 0µg, 0.00075µg and 0.0015µg of cadmium per millilitre from the reference solution (keep the remaining test solution for use in the test for lead and nickel).

**Source:** Cadmium hollow-cathode lamp.

**Wavelength:** 228.8 nm.

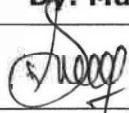

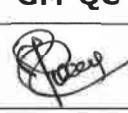

**Atomisation device:** Furnace.

**Platform:** Pyrolytically coated with integrated tube.

**Operating conditions:**

Use the temperature programme recommended for cadmium by the GFAA spectrometer manufacturer. An example of temperature parameters for GFAA analysis of cadmium is shown below.

Stage	Final temperature (°C)	Ramp time (s)	Hold time (s)

## 8. LEAD: (ATOMIC ABSORPTION SPECTROMETRY)

Not more than 10 ppm.

For the preparation of all aqueous solutions and for the rinsing of glassware before use, employ water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use.

Select all reagents to have as low a content of cadmium, lead and nickel as practicable and store all reagent solutions in containers of borosilicate glass. Clean glassware before use by soaking in warm 8M nitric acid for 30 min and by rinsing with deionised water.

### Blank solution:

Use the solution described in the test for cadmium.

### Modifier solution:

Use the solution described in the test for cadmium.

### Test solution:

Use the solution described in the test for cadmium.

### Reference solution:

Prepare a solution of 0.100 µg/mL of Pb by suitable dilutions of lead standard solution (100 ppm Pb) R with the blank solution.

Prepare mixtures of the test solution, the reference solution and the blank solution in the following proportions: (1.0:0:1.0 V/V/V), (1.0:0.5:0.5 V/V/V), (1.0:1.0:0 V/V/V). To each mixture add 50 µL of modifier solution and mix. These solutions contain respectively 0 µg, 0.025 µg and 0.05 µg of lead per millilitre from the reference solution.

**Source:** Lead hollow-cathode lamp.

**Wavelength:** 283.3 nm.

<b>10. LOSS ON DRYING: &lt; REFER GAM 026&gt;</b>  Not more than 6.0 per cent, determined on 1.0g by drying in an oven at 105°C.																	
<b>11. ASSAY:</b>  <b>Magnesium:</b>  Weigh 0.5g of sample in a 250ml conical flask, add 50ml of a mixture of equal volumes of anhydrous ethanol and butanol, 5ml of concentrated ammonia, 3ml of ammonium chloride buffer solution pH 10.0, 30.0ml of 0.1M sodium edetate and 15mg of mordant black II triturate. Heat at 45°C to 50°C until the solution is clear and titrate with 0.1M zinc sulphate until the colour changes from blue to violet. Carry out a blank titration.  1ml of 0.1 M sodium edetate is equivalent to 2.431 g of Mg.																	
<b>Calculation:</b>  $= \frac{\text{Titer value} - \text{Blank value} \times \text{Molarity of 0.1M disodium edetate} \times 2.431 \times 100 \times 100}{0.1 \times \text{Sample weight in mg} \times (100 - \text{Sample LOD})}$

1. DESCRIPTION: < REFER GAM 001>

Light, homogeneous, white or almost white powder, greasy to the touch (non abrasive).

2. SOLUBILITY: < REFER GAM 002>

10mg of sample + 100mL of water	Practically insoluble if the material does not dissolves.
10mg of sample + 100mL of Ethanol (96%)	Practically insoluble if the material does not dissolves.
10mg of sample + 100mL of dilute acids	Practically insoluble if the material does not dissolves.
10mg of sample + 100mL of dilute alkali hydroxides	Practically insoluble if the material does not dissolves.

3. IDENTIFICATION:

A) By IR: < REFER GAM 003>

The Infrared absorption spectrum of sample should be concordant with that of reference spectrum or with the spectrum obtained from Purified Talc WS.

B) By Chemical test:

In a platinum crucible, melt a mixture of 0.2g of anhydrous sodium carbonate and 2.0g of potassium carbonate. To the melted mass add 0.1g of the substance under examined and heat until the mixture is completely melted. Allow to cool and transfer the melted mass into an evaporating dish with 50ml of hot water. Add hydrochloric acid until effervescence ceases. Add 10ml of hydrochloric acid and evaporate to dryness on a water-bath. Allow to cool. Add 20ml of water, heat to boiling and filter (the residue is used for identification test C). To 5ml of the filtrate add 1ml of ammonia and 1ml of ammonium chloride solution and filter. To the filtrate add 1ml of disodium hydrogen phosphate solution. A white, crystalline precipitate is formed.

C) By Silicates:

Mix the residue obtained from Identification test B in a lead or platinum crucible mix by means of a copper wire with about 10 mg of sodium fluoride and a few drops of sulfuric acid to give a thin slurry.

<b>Name of Product</b>	PURIFIED TALC BP			
<b>STP No.</b>	RMETT0012-01	<b>Revision No.</b>	01	<b>Item Code.:</b> RMET0012
<b>Supersedes</b>	RMETT0012-00	<b>Effective Date</b>	24/02/2023	<b>Page No.:</b> 2 of 6

Cover the crucible with a thin, transparent plate of plastic under which a drop of water is suspended and warm gently. Within a short time a white ring is rapidly formed around the drop of water.

**Solution S1:**

Weigh 10.0 g into a conical flask fitted with a reflux condenser, gradually add 50 mL of 0.5 M hydrochloric acid while stirring and heat on a water-bath for 30 min. Allow to cool. Transfer the mixture to a beaker and allow the undissolved material to settle. Filter the supernatant through medium-speed filter paper into a 100 mL volumetric flask, retaining as much as possible of the insoluble material in the beaker. Wash the residue and the beaker with 3 quantities, each of 10 mL, of hot water. Wash the filter with 15 mL of hot water, allow the filtrate to cool and dilute to 100.0 mL with the same solvent.

**Solution S2:**

Perchlorates mixed with heavy metals are known to be explosive. Take proper precautions while performing this procedure Weigh 0.5 g in a 100 mL polytetrafluoroethylene dish, add 5 mL of hydrochloric acid, 5 mL of lead-free nitric acid and 5 mL of perchloric acid. Stir gently then add 35 mL of hydrofluoric acid and evaporate slowly to dryness on a hot plate. To the residue, add 5 mL of hydrochloric acid, cover with a watch-glass, heat to boiling and allow to cool. Rinse the watch-glass and the dish with water. Transfer into a volumetric flask, rinse the dish with water and dilute to 50.0 mL with the same solvent.

**4. ACIDITY OR ALKALINITY:**

Boil 2.5 g with 50 mL of carbon dioxide-free water under reflux. Filter in vacuo. To 10 mL of the filtrate add 0.1 mL of bromothymol blue solution; not more than 0.4 mL of 0.01 M hydrochloric acid is required to change the colour of the indicator to green. To 10 mL of the filtrate add 0.1 mL of phenolphthalein solution; not more than 0.3 mL of 0.01 M sodium hydroxide is required to change the colour of the indicator to pink.

**5. WATER SOLUBLE SUBSTANCES:**

Not more than 0.2%. To 10.0 g add 50 mL of carbon dioxide-free water, heat to boiling and maintain boiling under a reflux condenser for 30 min. Allow to cool, filter through a medium-speed filter paper and dilute to 50.0 mL with water.

Take 25.0 mL of the filtrate, evaporate to dryness and heat 105 °C for 1h. The residue weighs a maximum of 10 mg.

**6. ALUMINIUM: (ATOMIC ABSORPTION SPECTROMETRY)**

Not more than 2.0%

**Test solution:**

To 5.0 mL of solution S2 add 10 mL of a 25.34 g/L solution of caesium chloride, 10.0 mL of hydrochloric and dilute to 100.0 mL with water.

**Reference solutions:**

Into 4 identical volumetric flasks, each containing 10.0 mL of hydrochloric acid and 10 mL of a 25.34 g/L solution of caesium chloride, introduce respectively 5.0 mL, 10.0 mL, 15.0 mL and 20.0 mL of aluminium standard solution (100 ppm Al) and dilute to 100.0 mL with water.

**Source:** Aluminium hollow-cathode lamp.

**Wavelength:** 309.3 nm.

**Atomization device:** Nitrous oxide-acetylene flame.

**7. CALCIUM: (ATOMIC ABSORPTION SPECTROMETRY)**

Not more than 0.9 per cent.

**Test solution:**

To 5.0 mL of solution S2 add 10.0 mL of hydrochloric acid, 10 mL of lanthanum chloride solution and dilute to 100.0 mL with water.

**Reference solutions :**

Into 4 identical volumetric flasks, each containing 10.0 mL of hydrochloric acid and 10 mL of lanthanum chloride solution, introduce respectively 1.0 mL, 2.0 mL, 3.0 mL and 5.0 mL of calcium standard solution (100 ppm Ca) and dilute to 100.0 mL with water.

**Source:** Calcium hollow-cathode lamp.

**Wavelength:** 422.7 nm.

**Atomisation device:** Nitrous oxide-acetylene flame.

**8. IRON: < REFER GAM 007 > (ATOMIC ABSORPTION SPECTROMETRY)**

Not more than 0.25 percent.

**Test solution:**

To 2.5 mL of solution S1, add 50.0 mL of 0.5 M hydrochloric acid and dilute to 100.0 mL with water.

**Reference solutions:**

Into 4 identical volumetric flasks, each containing 50.0 mL of 0.5 M hydrochloric acid, introduce respectively 2.0 mL, 2.5 mL, 3.0 mL and 4.0 mL of iron standard solution (250 ppm Fe) and dilute to 100.0 mL with water.

**Source:** Iron hollow-cathode lamp.

**Wavelength:** 248.3 nm.

**Atomization device:** Air-acetylene flame. Correction Deuterium lamp.

**9. LEAD: (ATOMIC ABSORPTION SPECTROMETRY)**

Not more than 10 ppm.

**Test solution:** Use solution S1.

**Reference solutions:**

Into 4 identical volumetric flasks, each containing 50.0 mL of 0.5 M hydrochloric acid, introduce respectively 5.0 mL, 7.5 mL, 10.0 mL and 12.5 mL of lead standard solution (10 ppm Pb) and dilute to 100.0 mL with water.

**Source:** Lead hollow-cathode lamp.

**Wavelength:** 217.0 nm.

**Atomisation device:** Air-acetylene flame.

**10. MAGNESIUM: (ATOMIC ABSORPTION SPECTROMETRY)**

17.0 per cent to 19.5 per cent.

**Test solution:**

Dilute 0.5 mL of solution S2 to 100.0 mL with water. To 4.0 mL of the solution, add 10.0 mL of hydrochloric acid, 10 mL of lanthanum chloride solution and dilute to 100.0 mL with water.

**Reference solutions:**

Into 4 identical volumetric flasks, each containing 10.0 mL of hydrochloric acid and 10 mL of lanthanum chloride solution, introduce respectively 2.5 mL, 3.0 mL, 4.0 mL and 5.0 mL of magnesium standard solution (10 ppm Mg) and dilute to 100.0 mL with water.

**Source:** Magnesium hollow-cathode lamp.

**Wavelength:** 285.2 nm.

**Atomisation device:** Air-acetylene flame.

**11. LOSS ON IGNITION: < REFER GAM 027 >**

Maximum 7.0 per cent, determined on 1.00 g by ignition to constant weight at 1050-1100°C.

**12. MICROBIAL CONTAMINATION:**

Use 1.0g of sample for Total Microbial count.

**Total Aerobic microbial count:**

**Procedure:** Proceed as per the current general testing procedure GAM-035.

<b>Supersedes</b>	NIL	<b>Effective Date</b>	25/11/2024	<b>Page No.:</b> 1 of 3

**1. DESCRIPTION: < REFER GAM 001>**

A White to off white crystalline powder.

**2. SOLUBILITY: < REFER GAM 002>**

100mg of sample + 1mL of Water

Freely soluble if the material dissolves.

**3. IDENTIFICATION: < REFER GAM 003>**

**By Sodium test:**

Weigh accurately about 100.0mg of sample dissolved in 2ml of water, acidify with 1ml acetic acid and add large excess of magnesium uranyl acetate. A yellow crystalline precipitate is formed.

**4. BULK DENSITY:**

**Procedure:-**

Weigh 10.0g sample for Bulk Density, note down sample weight, and add in 50mL Measuring Cylinder. A Class Measuring Cylinder. Measure the Volume and Calculate Bulk Density by using following Formula,

$$\text{Bulk Density} = \frac{\text{Wt. of sample in g}}{\text{Volume in mL}}$$

**5. SIEVE SIZE:**

Weigh and transfer around 10.0g of the sample into 40 ASTM sieve and shake for 5 minutes. Collect the 40 ASTM passes (W40) from the sample collector.

$$\% \text{ passes on 40 ASTM} = \frac{\text{W40 in gram}}{\text{Weight of sample in g}} \times 100$$

<b>Supersedes</b>	NIL	<b>Effective Date</b>	25/11/2024	<b>Page No.:</b> 2 of 3

**6. LOSS ON DRYING: < REFER GAM 026 >**

Not more than 0.5%, determined on 1.0g of sample dried at  $100^{\circ}\text{C} \pm 2^{\circ}\text{C}$  for 3 hours to constant weight.

**7. ASSAY:**

**(i) Content of Selenite (as such basis):**

Weigh accurately about 80mg of sample, dissolve in 50ml of carbon dioxide-free water. Add 1.0ml of anhydrous formic acid, 25.0ml of 0.1M sodium thiosulphate and 0.5g of potassium iodide. Titrate immediately with 0.05M iodine using starch solution as indicator. Carry out a blank titration.

1ml of 0.1M Sodium thiosulphate is equivalent to 4.323mg of Sodium selenate.

**Calculation:**

$$\frac{\text{Titre value} - \text{Blank Value} \times \text{Molarity of 0.1M Sodium thiosulphate} \times 4.323 \times 100}{\text{Sample weight in mg} \times 0.1}$$

**(ii) Sodium selenate calculation:**

% of Sodium selenate (as such basis) = 100 - % of selenite.

<b>1.</b>	<b>DESCRIPTION: &lt; REFER GAM 001&gt;</b>  White or almost white, crystalline powder or colourless, transparent crystals.				
<b>2.</b>	<b>SOLUBILITY: &lt; REFER GAM 002&gt;</b> <table><tr><td>1g of sample + 1mL of water</td><td>Very soluble if the material dissolves.</td></tr><tr><td>10mg of sample + 100mL of ethanol (96%)</td><td>Practically insoluble if the material does not dissolves.</td></tr></table>	1g of sample + 1mL of water	Very soluble if the material dissolves.	10mg of sample + 100mL of ethanol (96%)	Practically insoluble if the material does not dissolves.
1g of sample + 1mL of water	Very soluble if the material dissolves.				
10mg of sample + 100mL of ethanol (96%)	Practically insoluble if the material does not dissolves.				
<b>3.</b>	<b>IDENTIFICATION: &lt; REFER GAM 003&gt;</b>  <b>A. By Sulfates:</b>  Take 5ml of solution S, add 1ml of dilute hydrochloric acid and 1ml of barium chloride solution; a white precipitate is formed.  <b>B. By Zinc:</b>  Take 5ml of the Solution S, add 0.2ml of strong sodium hydroxide solution; a white precipitate is formed. Add a further 2ml of strong sodium hydroxide solution; the precipitate dissolves. Add 10ml of ammonium chloride solution; the solution remains clear. Add 0.1ml of sodium sulfide solution; a flocculent white precipitate is formed.  <b>C. Limits of the assay:</b>  Not less than 99.0% and Not more than 101.0% w/w.  <b>SOLUTION S:</b>  Weigh accurately about 2.5g of sample dissolved in 50ml of carbon dioxide-free water (Solution S).  <b>4.</b>				
	<b>APPEARANCE OF SOLUTION: &lt; REFER GAM 023&gt;</b>  Solution S is clear and colourless.

<b>Name of Product</b>	ZINC SULPHATE MONOHYDRATE BP			
<b>STP No.</b>	STP-RMAZ0009-00	<b>Revision No.</b>	00	<b>Item Code.:</b> RMAZ0009
<b>Supersedes</b>	RMATZ0009-00	<b>Effective Date</b>	30/12/2023	<b>Page No.:</b> 2 of 3

<b>5. pH: &lt; REFER GAM 030 &gt;</b>	<p>Between 4.0 to 5.6, Determined on solution S.</p> <p>Rinse the electrodes with distilled water and wipe dry with tissue paper. Set the instrument using buffer solution pH 4.01 and 6.87 by following instrument Operating Procedure. Clean the electrode. Immerse the electrode in the solution being examined and measure the pH.</p>
<b>6. CHLORIDES: &lt; REFER GAM 008 &gt;</b>	<p>Maximum 300ppm.</p> <p>Dilute 3.3ml of solution S to 15.0ml with water.</p>
<b>7. IRON: &lt;REFER GAM 007&gt;</b>	<p>Maximum 100ppm.</p> <p>Dilute 2ml of solution S to 10ml with water. Using 0.5ml of thioglycollic acid.</p>
<b>8. ASSAY: (By Titration)</b>	<p>Weigh accurately about 0.160g of sample dissolved in 5ml of dilute acetic acid into a 500ml conical flask and dilute to 200ml with water. Add about 50mg of xylenol orange triturate and hexamethylenetetramine until the solution becomes violet-pink; add 2g of hexamethylenetetramine in excess. Titrate with 0.1M sodium edetate until the violet-pink colour changes to yellow.</p> <p>Each mL of 0.1M sodium edetate is equivalent to 17.95mg of ZnSO<sub>4</sub> H<sub>2</sub>O.</p> <p><b>Calculation:</b></p> $\frac{\text{Titer value} \times \text{Molarity of 0.1M sodium edetate} \times 17.95 \times 100}{\text{Sample weight in (mg)} \times 0.1}$
